# ADMIN INFO

- Grading (tentative):
  - Homeworks: 40%
  - Project/independent study: 25%
  - Final exam: 30%
  - Scribing lectures: 5%
- Intended audience: Students considering further study in theoretical computer science.

# ACADEMIC HONESTY

- You may do your homeworks in groups of size at most 3. You must write the names of all your collaborators in the submissions.
- At the discretion of the instructors, you may be asked further questions regarding your submissions, including but not limited to, solving additional problems in the presence of the instructors and within a stipulated time.
- In case you are found to have used unfair means in any aspect of this course, the instructors, at their discretion, may impose any penalty ranging from reducing 1 grade to awarding an F in this course.

# RESEARCH IN THEORETICAL COMPUTER SCIENCE

- Designing algorithms/mechanisms/cryptosystems
  - E0 225
  - Approximation algorithms
  - Randomized algorithms
  - Streaming algorithms
  - Learning algorithms
  - .....
- Proving computational lower bounds

# RANDOMIZED ALGORITHMS

- Quicksort, hashing, etc.
- Given an array of  $n$  numbers promised to be one of the following two cases
  - All elements are 0
  - $n/2$  elements are 0 and  $n/2$  elements are 1
- Any deterministic algorithm will take time  $\Omega(n)$ .

# RANDOMIZED ALGORITHMS

- Pick a random location on the array and check its value.

$\Pr[\text{Alg outputs correct answer}] = \frac{1}{2}$ . Running time =  $O(1)$ .

- Repeat  $k$  times

$\Pr[\text{Alg outputs correct answer}] = 1 - \frac{1}{2^k}$ . Running time =  $O(k)$ .

# APPROXIMATION ALGORITHMS

- Min s-t cut

Given a graph  $G = (V, E)$ , compute a set  $S \subset V$  such that number of edges that have one vertex in  $S$  and one vertex in  $V \setminus S$  is minimized.

This problem has a polynomial time algorithm.

- Flow based algorithms
- LP based algorithms

- Max-cut

Given a graph  $G = (V, E)$ , compute the set  $S \subset V$  such that number of edges that have one vertex in  $S$  and one vertex in  $V \setminus S$  is ~~minimize~~ **maximized**.

- This problem is NP-hard!

- Random cut cuts half the edges!

Add each vertex to  $S$  independently with probability  $\frac{1}{2}$  and  $V \setminus S$  with probability  $\frac{1}{2}$ .

- Fix an edge  $\{u, v\}$

$$\begin{aligned}\Pr[\{u, v\} \text{ is cut}] &= \Pr[u \in S] * \Pr[v \in V \setminus S] + \Pr[u \in V \setminus S] * \Pr[v \in S] \\ &= \frac{1}{2} * \frac{1}{2} + \frac{1}{2} * \frac{1}{2} = \frac{1}{2}\end{aligned}$$

# MAX-CUT

- $E[\textit{number of edges cut}] = \frac{1}{2} |E| \geq \frac{1}{2} \text{max-cut}$
- Convex optimization based approaches give 0.878 approximation!
  - Uses geometric and probabilistic tools.
- Best possible (assuming a certain complexity theoretic conjecture)!

# LINEAR ALGEBRAIC TOOLS

- Top singular vector gives the best fit line!
- Top few singular vectors give best fit subspace.
- Low rank approximation of matrices.
- Many other applications!

Noisy data points

# EIGENVALUES OF GRAPHS

- For a  $d$ -regular graph, the largest eigenvalue of its adjacency matrix is  $d$ .
- Graph is disconnected if and only if second largest eigenvalue is  $= d$ .
- If second largest eigenvalue is  $\ll d$ , then graph is “well connected”.
- If graph has  $k$  eigenvalues “close” to  $d$ , then it can be partitioned into  $k$  parts that are “sparsely” connected with each other.

# BOOLEAN FUNCTIONS AND DISCRETE FOURIER ANALYSIS

$$f: \{-1, 1\}^n \rightarrow \{-\mathbb{R}, 1\}$$

- Boolean functions can be uniquely represented as multilinear polynomials.
- Property testing, probabilistically checkable proofs, etc.
- Can be extended to non-Boolean functions as well.

# LINEARITY TESTING

$$f(x + y) = f(x) + f(y) \quad \forall x, y, z \in \{-1, 1\}^n$$

- Sample  $x, y, z \sim \{-1, 1\}^n$  independently and uniformly at random, and check if  $f(x + y) = f(x) + f(y)$
- If  $f$  is “far” from being a linear function, then the probability of test accepting is “small”.

# *commonly* (TOOLS USED IN) RESEARCH IN THEORETICAL COMPUTER SCIENCE

- **Probabilistic methods:** Moments, Lovasz local lemma, martingales, random graphs, applications, etc.
- **Information theory:** Shearer's Lemma, entropy and compression, Pinsker's lemma, KL-divergence, applications, etc.
- **Linear algebraic tools:** Courant-Fischer theorem, SVD, Cheeger's inequality, expanders, etc.
- **Discrete Fourier analysis:** and applications, etc.
- **Multiplicative weights update method:** and applications, online convex optimization, etc.
