

Data-flow Analysis / Abstract Interpretation

Deepak D'Souza and K. V. Raghavan

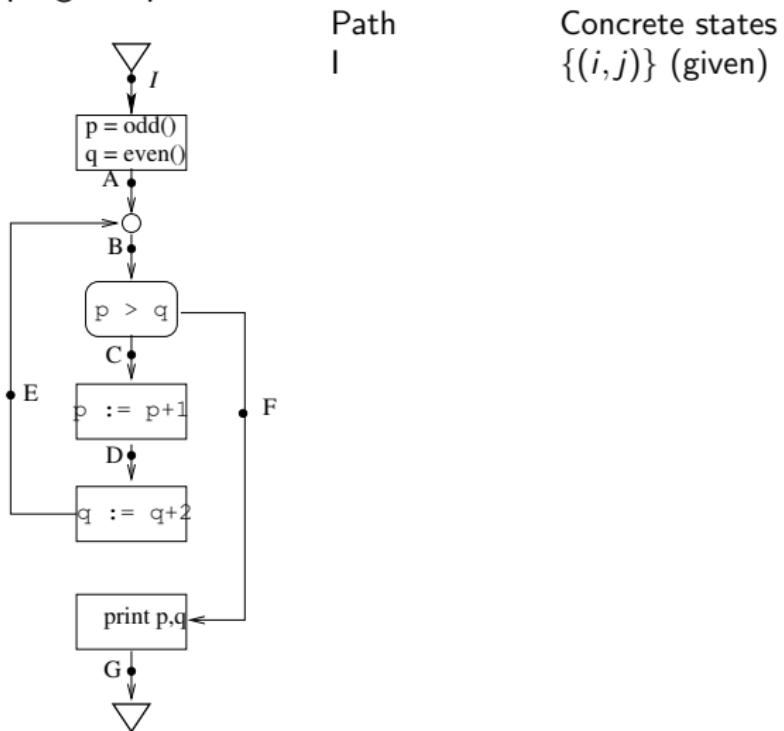

IISc

What is data-flow analysis

- “Computing ‘safe’ approximations to the set of values / behaviours arising dynamically at run time, statically or at compile time.”
- Typically used by compiler writers to optimize running time of compiled code.
 - Constant propagation: Is the value of a variable constant at a particular program location.
 - Replace $x := y + z$ by $x := 17$ during compilation.
- More recently, used for verifying properties of programs.

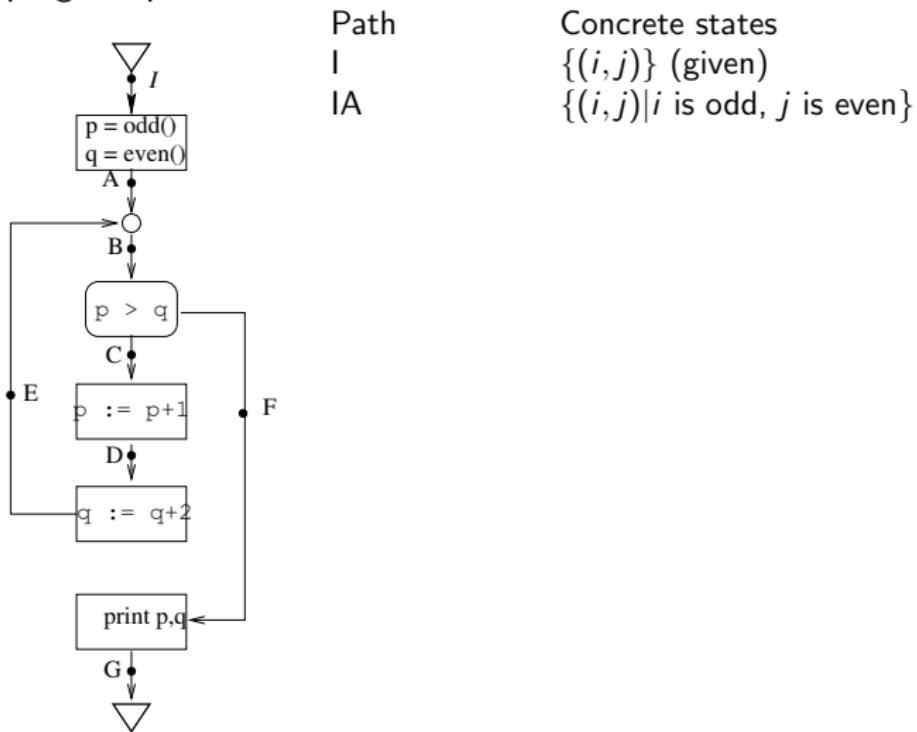

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

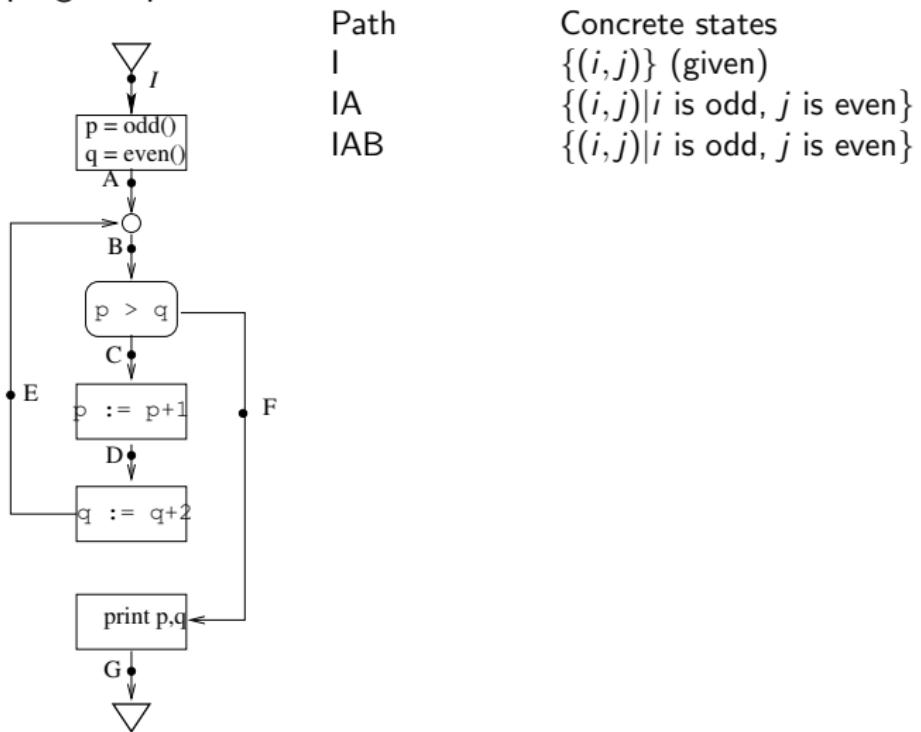

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

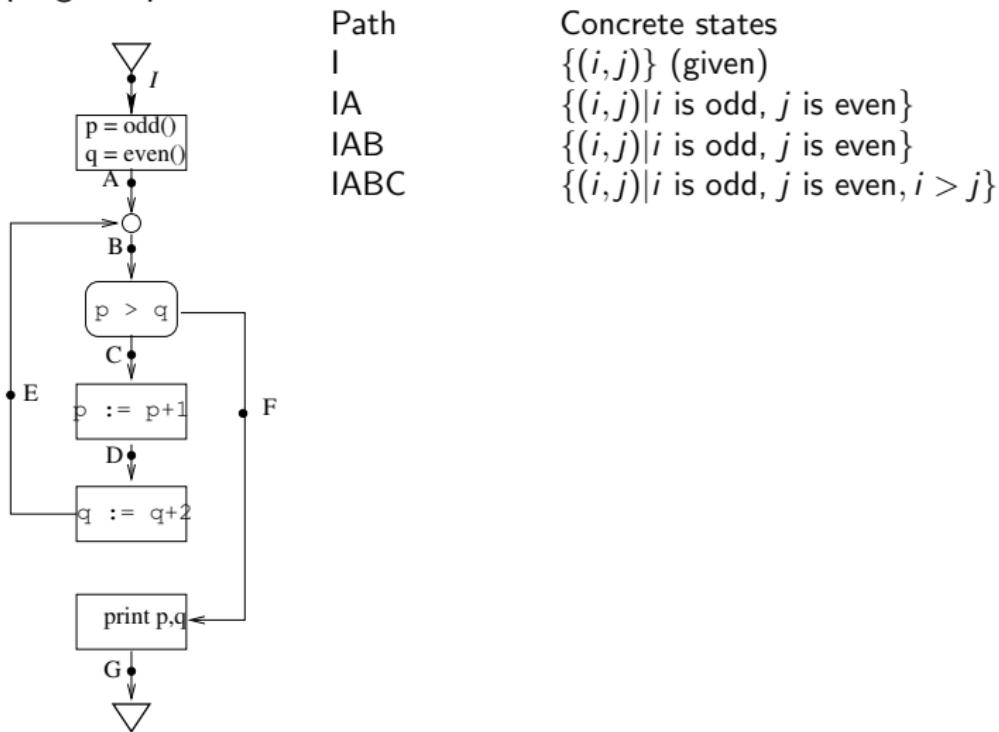

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

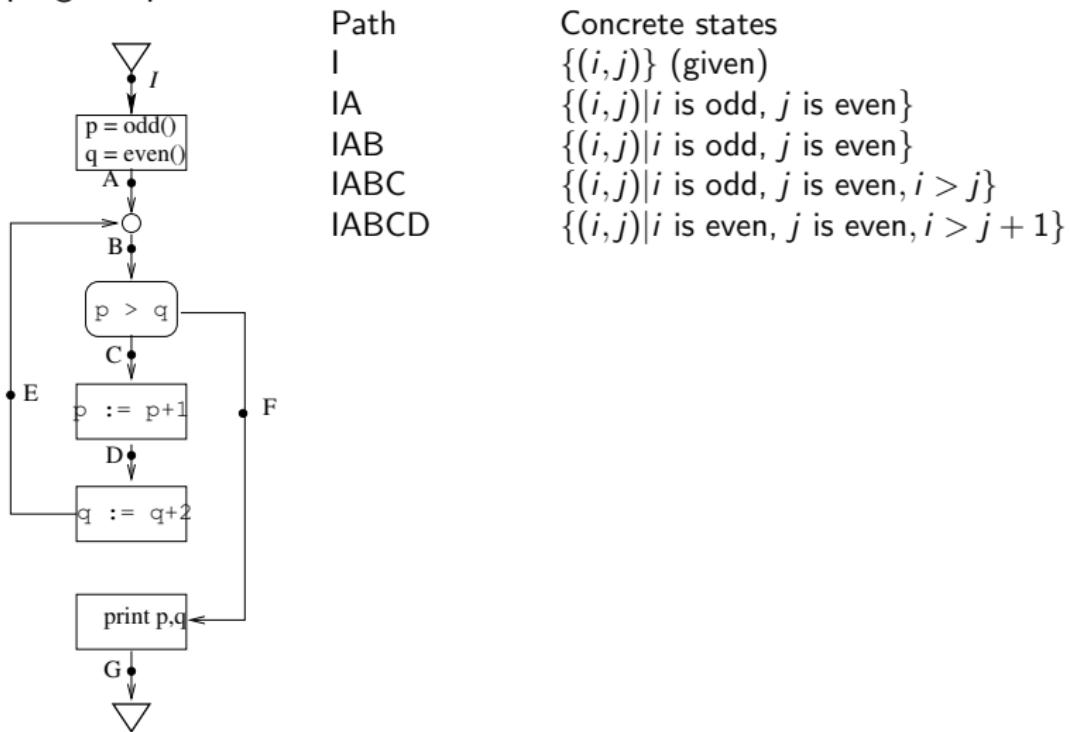

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

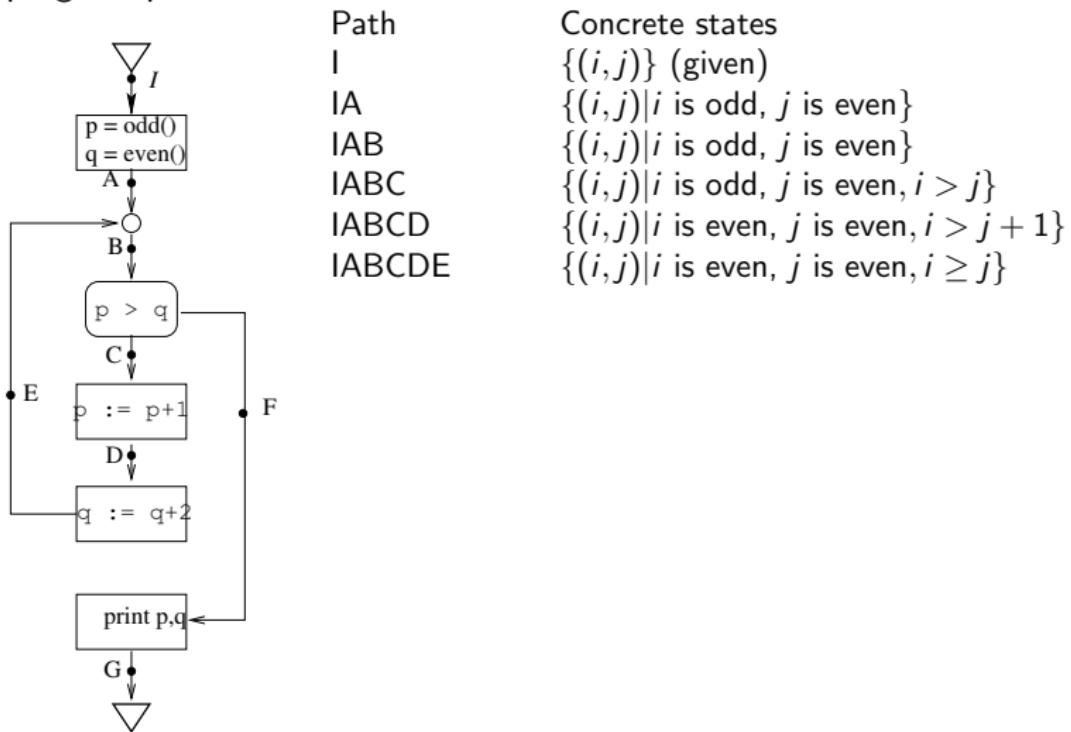

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

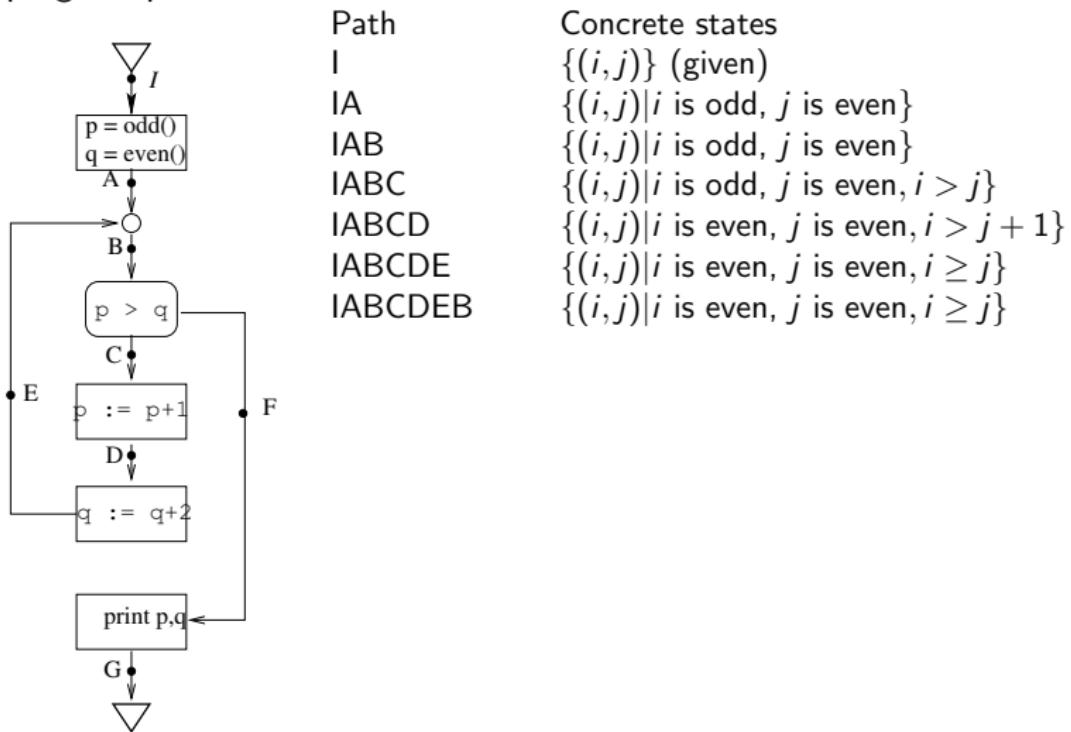

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

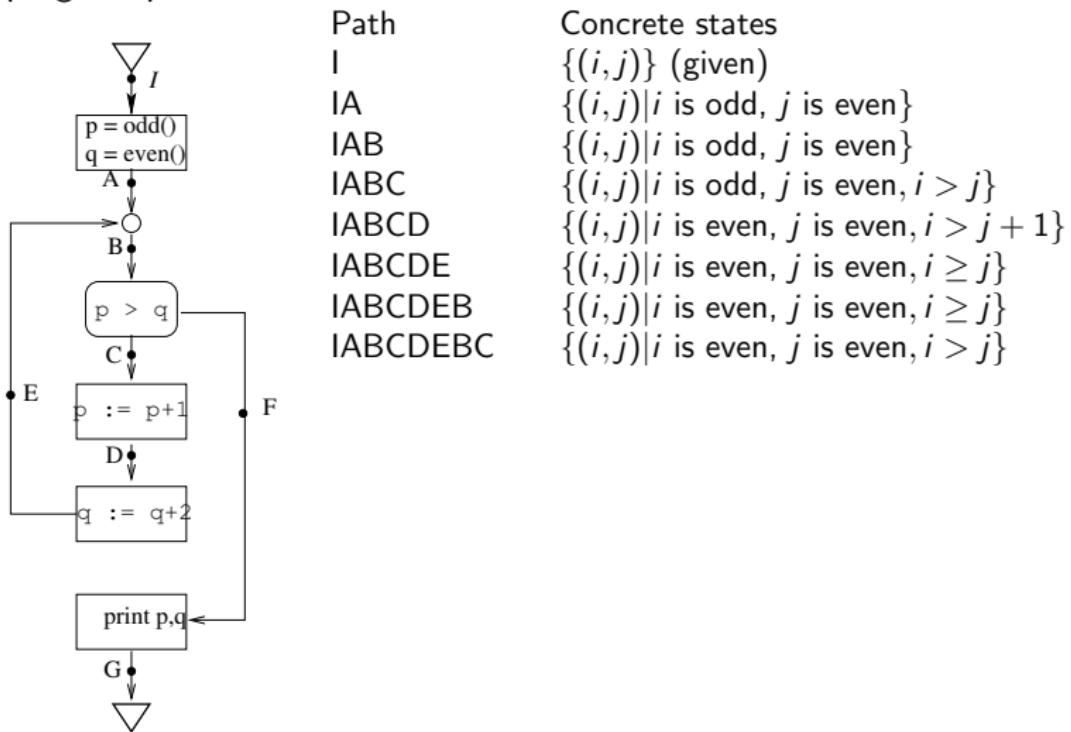

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

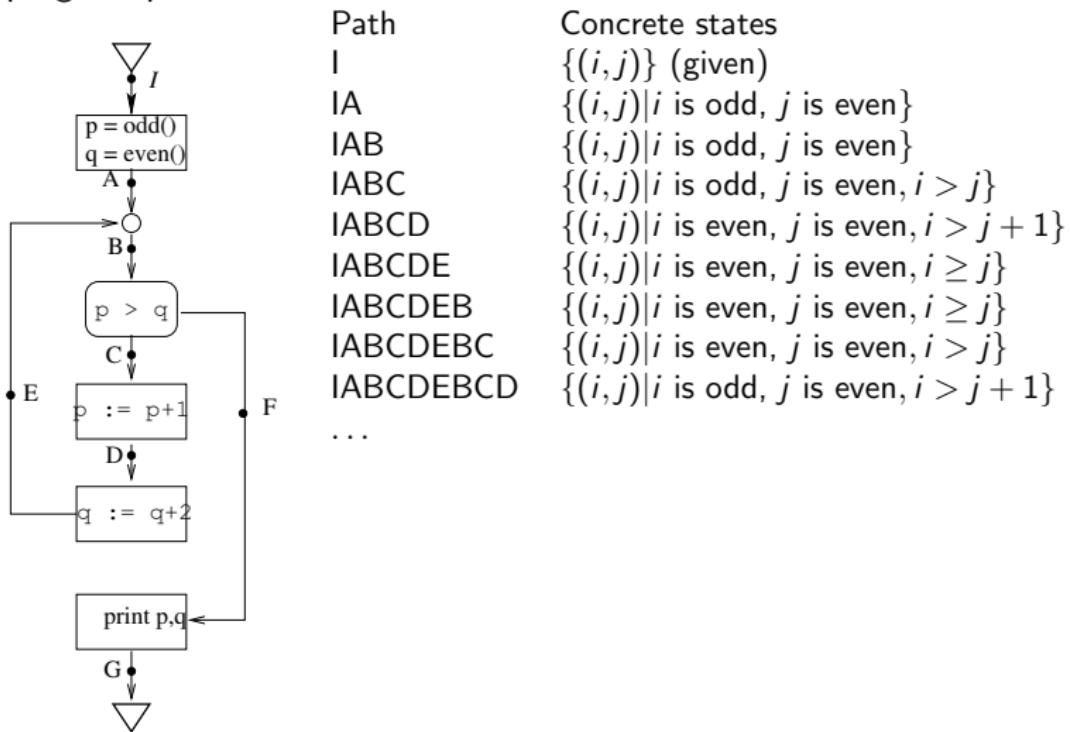

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

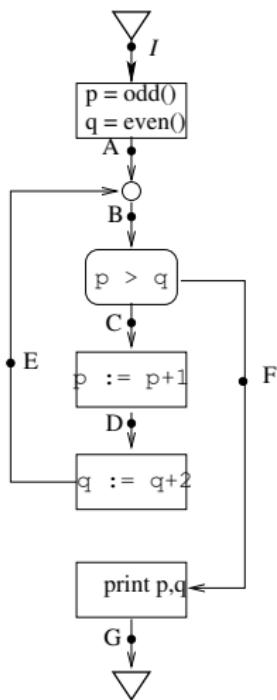

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

Collecting semantics – example

Collecting semantics of a program = set of (concrete) states occurring at each program point.

Path	Concrete states
I	$\{(i,j)\}$ (given)
IA	$\{(i,j) i \text{ is odd, } j \text{ is even}\}$
IAB	$\{(i,j) i \text{ is odd, } j \text{ is even}\}$
IABC	$\{(i,j) i \text{ is odd, } j \text{ is even, } i > j\}$
IABCD	$\{(i,j) i \text{ is even, } j \text{ is even, } i > j+1\}$
IABCDE	$\{(i,j) i \text{ is even, } j \text{ is even, } i \geq j\}$
IABCDEB	$\{(i,j) i \text{ is even, } j \text{ is even, } i \geq j\}$
IABCDEBC	$\{(i,j) i \text{ is even, } j \text{ is even, } i > j\}$
IABCDEBCD	$\{(i,j) i \text{ is odd, } j \text{ is even, } i > j+1\}$
...	

Therefore, collecting semantics:

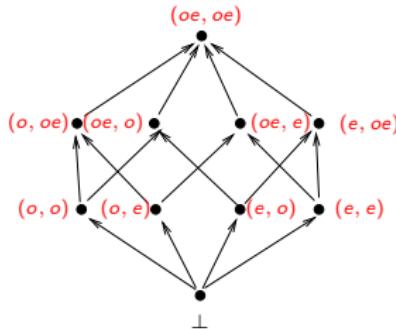

I	$\{(i,j)\}$
A	$\{(i,j) i \text{ odd, } j \text{ even}\}$
B	$\{(i,j) i \text{ odd, } j \text{ even}\} \cup \{(i,j) i \text{ even, } j \text{ even, } i \geq j\}$
C	$\{(i,j) j \text{ even, } i > j\}$
D	$\{(i,j) j \text{ even, } i > j+1\}$
E	$\{(i,j) j \text{ even, } i \geq j\}$
F	$\{(i,j) i \text{ odd, } j \text{ even, } i < j\} \cup \{(i,j) i \text{ even, } j \text{ even, } i = j\}$

Components of an abstract interpretation:

- Set of **abstract states** D , forming a complete lattice.
- “**Concretization**” function $\gamma : D \rightarrow 2^{\text{State}}$, which associates a set of concrete states with each abstract state.
- **Transfer function** $f_n : D \rightarrow D$ for each type of node n , which “interprets” each program statement using the abstract states.

Abstract interpretation – example

- Abstract lattice D

- Transfer function for an assignment node n : $p := p+q$

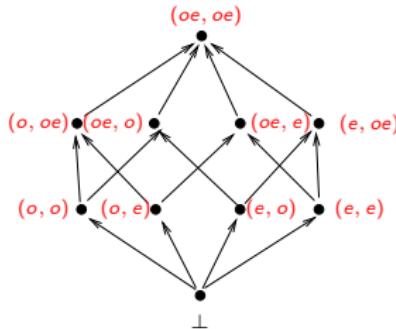

$$f_n(s) = \begin{cases} \perp & \text{if } s \text{ is } \perp \\ (o, s[q]) & \text{if } s[p] \text{ is } o \text{ and } s[q] \text{ is } e, \\ & \text{or } s[p] \text{ is } e \text{ and } s[q] \text{ is } o \\ (e, s[q]) & \text{if both } s[p] \text{ and } s[q] \text{ are } o \\ & \text{or both } s[p] \text{ and } s[q] \text{ are } e \\ (oe, s[q]) & \text{otherwise} \end{cases}$$

- The concretization function γ

- $\gamma((oe, oe)) =$

Abstract interpretation – example

- Abstract lattice D

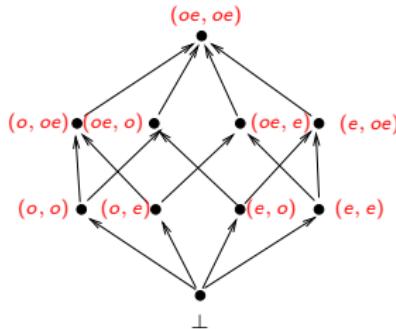

- Transfer function for an assignment node n : $p := p+q$

$$f_n(s) = \begin{cases} \perp & \text{if } s \text{ is } \perp \\ (o, s[q]) & \text{if } s[p] \text{ is } o \text{ and } s[q] \text{ is } e, \\ & \text{or } s[p] \text{ is } e \text{ and } s[q] \text{ is } o \\ (e, s[q]) & \text{if both } s[p] \text{ and } s[q] \text{ are } o \\ & \text{or both } s[p] \text{ and } s[q] \text{ are } e \\ (oe, s[q]) & \text{otherwise} \end{cases}$$

- The concretization function γ
 - $\gamma((oe, oe)) = \text{State}$, $\gamma(\perp) =$

Abstract interpretation – example

- Abstract lattice D

- Transfer function for an assignment node n : $p := p+q$

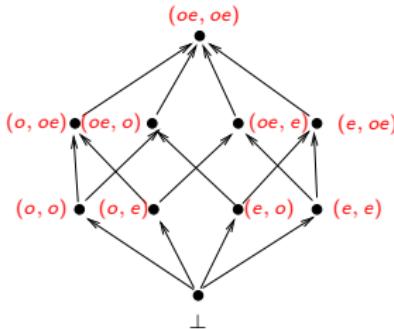

$$f_n(s) = \begin{cases} \perp & \text{if } s \text{ is } \perp \\ (o, s[q]) & \text{if } s[p] \text{ is } o \text{ and } s[q] \text{ is } e, \\ & \text{or } s[p] \text{ is } e \text{ and } s[q] \text{ is } o \\ (e, s[q]) & \text{if both } s[p] \text{ and } s[q] \text{ are } o \\ & \text{or both } s[p] \text{ and } s[q] \text{ are } e \\ (oe, s[q]) & \text{otherwise} \end{cases}$$

- The concretization function γ

- $\gamma((oe, oe)) = \text{State}$, $\gamma(\perp) = \emptyset$, $\gamma((o, oe)) =$

Abstract interpretation – example

- Abstract lattice D

- Transfer function for an assignment node n : $p := p+q$

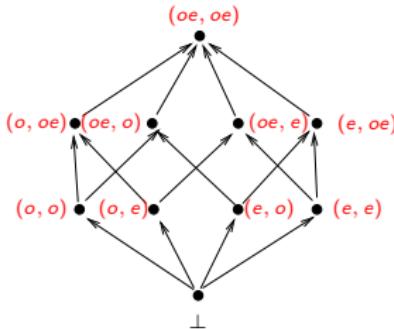

$$f_n(s) = \begin{cases} \perp & \text{if } s \text{ is } \perp \\ (o, s[q]) & \text{if } s[p] \text{ is } o \text{ and } s[q] \text{ is } e, \\ & \text{or } s[p] \text{ is } e \text{ and } s[q] \text{ is } o \\ (e, s[q]) & \text{if both } s[p] \text{ and } s[q] \text{ are } o \\ & \text{or both } s[p] \text{ and } s[q] \text{ are } e \\ (oe, s[q]) & \text{otherwise} \end{cases}$$

- The concretization function γ

- $\gamma((oe, oe)) = \text{State}$, $\gamma(\perp) = \emptyset$, $\gamma((o, oe)) = \{(m, n) \mid m \text{ is odd}\}$
- $\gamma((o, e)) =$

Abstract interpretation – example

- Abstract lattice D

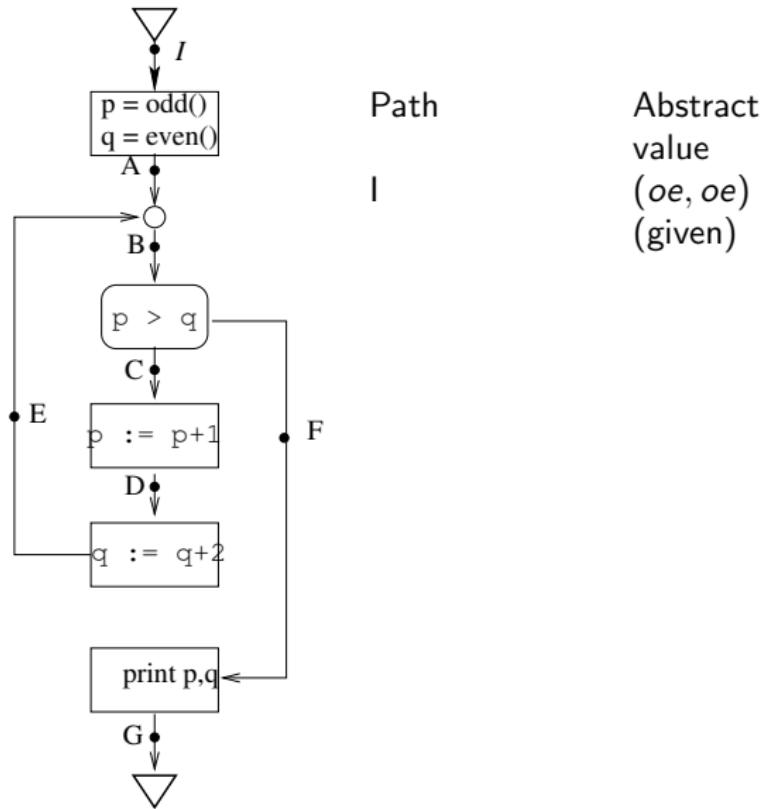

- Transfer function for an assignment node n : $p := p+q$

$$f_n(s) = \begin{cases} \perp & \text{if } s \text{ is } \perp \\ (o, s[q]) & \text{if } s[p] \text{ is } o \text{ and } s[q] \text{ is } e, \\ & \text{or } s[p] \text{ is } e \text{ and } s[q] \text{ is } o \\ (e, s[q]) & \text{if both } s[p] \text{ and } s[q] \text{ are } o \\ & \text{or both } s[p] \text{ and } s[q] \text{ are } e \\ (oe, s[q]) & \text{otherwise} \end{cases}$$

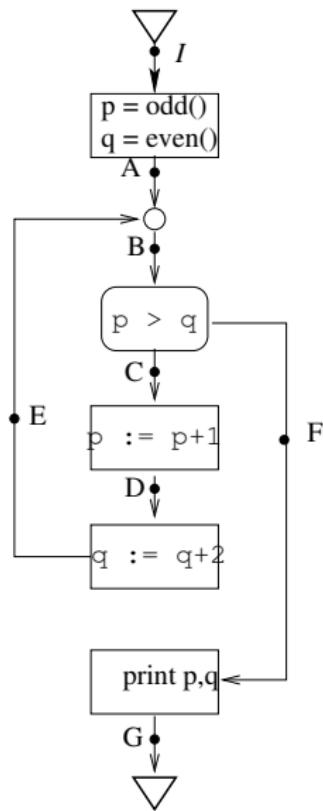

- The concretization function γ

- $\gamma((oe, oe)) = \text{State}$, $\gamma(\perp) = \emptyset$, $\gamma((o, oe)) = \{(m, n) \mid m \text{ is odd}\}$
- $\gamma((o, e)) = \{(m, n) \mid m \text{ is odd and } n \text{ is even}\}, \dots$

This is *abstract join-over-all-paths*
(JOP) solution.

Comparison of abstract JOP states and collecting states

Abstract JOP:

- A (o, e)
- B (oe, e)
- C (oe, e)
- D (oe, e)
- E (oe, e)
- F (oe, e)

Collecting states:

- A $\{(i, j) | i \text{ odd, } j \text{ even}\}$
- B $\{(i, j) | i \text{ odd, } j \text{ even}\} \cup \{(i, j) | i \text{ even, } j \text{ even, } i \geq j\}$
- C $\{(i, j) | j \text{ even, } i > j\}$
- D $\{(i, j) | j \text{ even, } i > j + 1\}$
- E $\{(i, j) | j \text{ even, } i \geq j\}$
- F $\{(i, j) | i \text{ odd, } j \text{ even, } i < j\} \cup \{(i, j) | i \text{ even, } j \text{ even, } i = j\}$

Comparison of abstract JOP states and collecting states

Abstract JOP:	Collecting states:
A (o, e)	A $\{(i, j) i \text{ odd, } j \text{ even}\}$
B (oe, e)	B $\{(i, j) i \text{ odd, } j \text{ even}\} \cup \{(i, j) i \text{ even, } j \text{ even, } i \geq j\}$
C (oe, e)	C $\{(i, j) j \text{ even, } i > j\}$
D (oe, e)	D $\{(i, j) j \text{ even, } i > j + 1\}$
E (oe, e)	E $\{(i, j) j \text{ even, } i \geq j\}$
F (oe, e)	F $\{(i, j) i \text{ odd, } j \text{ even, } i < j\} \cup \{(i, j) i \text{ even, } j \text{ even, } i = j\}$

Note that at each point γ image of abstract solution is over-approximation of collecting states.

A given abstract interpretation is said to be *correct* if, for all abstract states $d_0 \in D$, for all programs P and for all program points p in P ,

γ image of join of all abstract states arising at p (i.e., abstract JOP solution at p), with d_0 as the initial abstract value at P 's entry

collecting semantics at p , with $\gamma(d_0)$ as the initial set of concrete states at P 's entry

A given abstract interpretation is said to be *correct* if, for all abstract states $d_0 \in D$, for all programs P and for all program points p in P ,

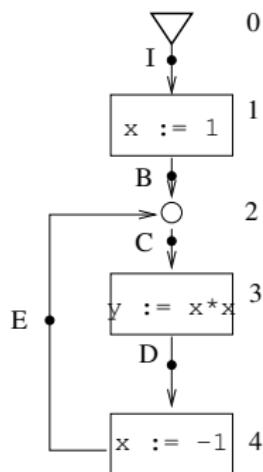

γ image of join of all abstract states arising at p (i.e., abstract JOP solution at p), with d_0 as the initial abstract value at P 's entry

collecting semantics at p , with $\gamma(d_0)$ as the initial set of concrete states at P 's entry

We will study later certain sufficient conditions for a given abstract interpretation to be correct.

Another example program

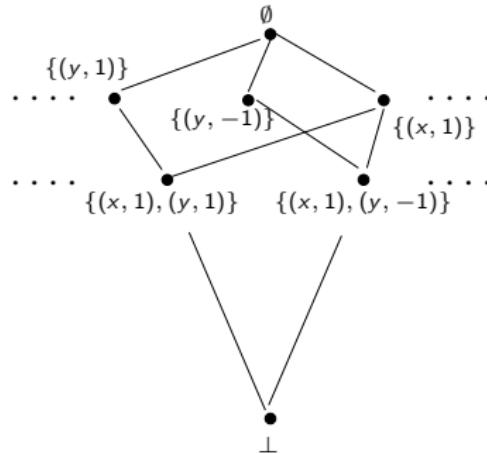

Path	Characterization of concrete states
I	<i>true</i> (given)
IB	$x = 1$
IBC	$x = 1$
IBCD	$x = 1 \wedge y = 1$
ICBDE	$x = -1 \wedge y = 1$
ICBDEC	$x = -1 \wedge y = 1$
ICBDECD	$x = -1 \wedge y = 1$
...	$x = -1 \wedge y = 1$

Therefore, collecting semantics:

Point	Characterization of concrete states
I	<i>true</i>
B	$x = 1$
C	$(x = 1) \vee (x = -1 \wedge y = 1)$
D	$(y = 1) \wedge (x = -1 \vee x = 1)$
E	$x = -1 \wedge y = 1$

Verify that

- at points I, B and E
 $\gamma(\text{abstract JOP value}) = \text{collecting semantics.}$
- at points C and D
 $\gamma(\text{abstract JOP value}) \supset \text{collecting semantics.}$
- the abstract transfer functions given are the *best* possible for the given lattice L . That is, imprecision is due to the lattice, not the transfer functions.

Formal definition of control-flow graphs

Programs are finite directed graphs with following nodes (statements):

Nodes or statements in a program

- Expressions:

$$e ::= c \mid x \mid e + e \mid e - e \mid e * e.$$

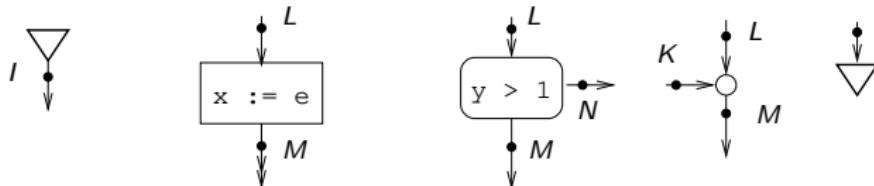

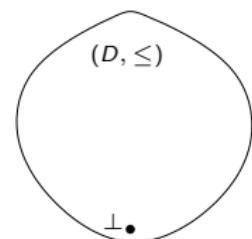

- Boolean expressions:

$$be ::= tt \mid ff \mid e \leq e \mid e = e \mid \neg be \mid be \vee be \mid be \wedge be.$$

- Assume unique initial program point I .

Formal definition of an abstract interpretation

- Complete join semi-lattice (D, \leq) , with a least element \perp .
- Concretization function $\gamma : D \rightarrow 2^{State}$
- $\perp \in D$ represents unreachability of the program point (i.e., $\gamma(\perp)$ should be equal to \emptyset). Also, $\gamma(\top)$ should be *State*.
- We require transfer functions f_{LM}, f_{LN}, f_{KM} for all scenarios below:

- We assume transfer functions are monotonic, and satisfy $f(\perp) = \perp$.
- For junction nodes, both transfer functions should be *identity*

What we want to compute for a given program

- Path in a program: Sequence of connected edges or program points, beginning at initial point I
- Transfer functions extend to paths in program:

$$f_{IBCD} = f_{CD} \circ f_{BC} \circ f_{IB}.$$

where $(f_a \circ f_b)(x)$ is defined as $f_a(f_b(x))$.

- f_p is $\lambda d. \perp \Rightarrow$ path p is *infeasible*.
- Join over all paths (JOP) definition: For each program point N

$$d_N = \bigsqcup_{\text{paths } p \text{ from } I \text{ to } N} f_p(d_0).$$

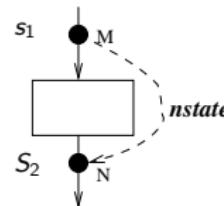

where d_0 is a given initial abstract value at entry node.

Formalization of collecting semantics

- Let Val be the set of all *concrete* values; e.g., $\text{Integer} \cup \text{Boolean}$.
- $State$ is normally the domain $\text{Var} \rightarrow Val$. However, in general, it can be any semantic domain.

- Program semantics is given by the functions $nstate_{MN} : State \rightarrow 2^{State}$

- These induce the functions $nstate' : 2^{State} \rightarrow 2^{State}$

$$nstate'_{MN}(S_1 \in 2^{State}) = \bigcup_{s_1 \in S_1} nstate_{MN}(s_1)$$

- Collecting semantics SS is a map $ProgramPoints \rightarrow 2^{State}$
- At each program point N ,

$$SS(N) = \bigcup_{p \text{ path from } I \text{ to } N} nstate'_p(S_0).$$

where I is entry point of CFG, S_0 is the given initial set of states, and $nstate'_p$ is composition of $nstate'$ functions of edges that constitute p .
